Abstract
The aim of this study is to explore the effect of trust perceptions of hotel employees in their managers on their organizational identification behavior and intention to quit. Initially, a literature review was performed and then a questionnaire was used to gather data. To analyze the data, T-test and variance analysis were carried out and Tukey and Tamhane tests were used as well. Lastly, structural equation modeling (SEM) was done to identify the degree and direction of the relationships. As a result of the T-test analyses, significant differences were found in 95% confidence level between the age groups and organizational identification (p=0.001) and intention to quit (p=0.000). Besides, it was identified that organizational identification behavior has an adverse effect on intention to quit (γ = -0.008). It was concluded that the higher the perception of trust in the manager, the higher the organizational identification behavior and the lower the intention to quit.
